

DGL Version Compatibility

This document explains which DGL (Deep Graph Library) versions PolicyGraph supports, why, and how to install the correct one.

Available DGL Versions

The DGL project ships pre-built wheels from

<https://data.dgl.ai/wheels/repo.html> (<https://data.dgl.ai/wheels/repo.html>).

At the time of writing the available releases include:

- 1.0.2
- 1.1.0 , 1.1.1 , 1.1.2  (PolicyGraph uses **1.1.2**)
- 2.0.0 , 2.0.0+cu118 , 2.0.0+cu121 
- 2.2.1 , 2.2.1+cu118 , 2.2.1+cu121 

 `dgl==1.1.3` **does NOT exist**. Older PolicyGraph instructions referenced `1.1.3` by mistake. If you see a `No matching distribution found for dgl==1.1.3` error, that is why. Use `1.1.2` instead.

Why 1.1.2?

- **Latest stable 1.1.x release** — most polished bug-fix release in the 1.1 series.
- **No graphbolt dependency**. DGL 2.x introduced a hard dependency on `graphbolt`, which has its own build/runtime issues on Windows and Python 3.11. PolicyGraph does not need the 2.x feature set, so we stay on 1.1.x to keep installs reliable.
- **Works with PyTorch 2.0+**. Compatible with the `torch>=2.0.0` declared in `setup.py` / `requirements.txt`.
- **Compatible with Python 3.9, 3.10, and 3.11**. DGL 1.1.x does not publish wheels for Python 3.12+, which is also why PolicyGraph's `setup.py` rejects 3.12+.

Canonical Version Spec

PolicyGraph declares DGL as:

```
dgl>=1.1.0,<1.2.0
```

That range resolves to `1.1.2` today (the highest 1.1.x available) and will continue to work if a future `1.1.3` is ever published — but it will **not** silently jump to 2.x.

Installation

DGL wheels are not on PyPI for every platform, so always include the DGL wheel index when installing directly.

Windows (CPU)

```
pip install dgl==1.1.2 -f https://data.dgl.ai/wheels/repo.html
```

Linux / Mac (CPU)

```
pip install dgl==1.1.2 -f https://data.dgl.ai/wheels/repo.html
```

Range form (equivalent, future-proof within 1.1.x)

```
pip install 'dgl>=1.1.0,<1.2.0' -f https://data.dgl.ai/wheels/repo.html
```

GPU (CUDA 11.8) — optional

```
pip install dgl-cu118==1.1.2 -f https://data.dgl.ai/wheels/repo.html
```

Verifying Your Install

```
python -c "import dgl; print('DGL version:', dgl.__version__)"
```

Expected output:

```
DGL version: 1.1.2
```

`setup.py` also prints a warning during install if it detects a DGL version outside the 1.1.x range.

Python Version

PolicyGraph supports **Python 3.9, 3.10, or 3.11** (DGL 1.1.x does not publish wheels for 3.12+). `setup.py` will hard-fail on unsupported interpreters with a clear message.
